## THE NUMBER OF OBESE TRANSPORTS WILL CONTINUE TO INCREASE — ARE YOU READY ?

According to the U.S. Centers for Disease Control, "an estimated 129.6 million Americans, or 64 percent, are overweight or obese."<sup>1</sup>

The Rand Corporation states: "The proportion of Americans who suffer from clinically severe obesity—defined as those who are 100 or more pounds overweight—is rising twice as fast as the proportion of those who are simply obese."<sup>2</sup>

Increasingly, you are being called upon to provide transportation services to these "Bariatric" patients. But what about the risks? While you probably invested in bariatric stretchers to handle the weight of the bariatric patients, the task of

loading them is still handled by manual lifting.

Lifting and moving bariatric patients may cause serious injury. Typical back injury costs can reach \$40,000 to \$50,000, including health care, lost time and Worker's Compensation costs.

Avoid injuries and reduce lost time injuries associated with transporting bariatric patients.

**TranSafeSystems** bariatric loading device is the best solution to loading and unloading bariatric patients into your ambulance.
